

The National Collegiate Emergency Medical Services Foundation, Annual Conference, Marriott Inner Harbor, Baltimore, MD, February 24<sup>th</sup> 2007

## Ambulance Safety: Everything that you need to know!

Nadine Levick, MD MPH  
Research Director,  
EMS Safety Foundation  
New York, USA

## A tragic emergency health care intervention outcome

It does happen....

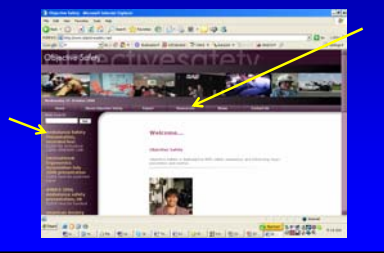

## A devastating tragedy...

- ▶ An ETT down the wrong hole may kill your patient and be a terrible burden for the pts family and for the medic involved
- ▶ BUT an EMS crash can kill all involved AND wipe out an EMS systems response capacity.....

Your Interactive Handout awaits you online...

▶ [www.objectivesafety.net](http://www.objectivesafety.net)

<http://www.objectivesafety.net>

## Fatalities and funerals

## Outline

- ▶ Review of data on ambulance crashes and crash safety
- ▶ Identification of safety issues, hazards and areas of risk for EMS vehicles
- ▶ Review of safety standards and guidelines, and an update of the latest safety developments
- ▶ Strategies to enhance safety and reduce risks of EMS transport related crash and injury

Firstly!

▶ An accident ?

▶ or a predictable and preventable event

### EMS Best Practice, Sept 2006

**12. What can emergency services leaders do to their own organizations to prevent ambulance safety?**

Full back an obvious safety check, proper equipment - oxygen cylinders, defibrillators, call phones, there is no excuse for not being on. Encouraged skills, officers have control versus life threatening signs. A call phone to the head at 40 miles per hour can kill you.

Every scene presents with un-desirable outcomes. If incidentally involved, have them sit or upright in position. If a safety, fast belt all passengers, wear seatbelts - require that themselves and others. Most of the time EMS providers do not need to care around the vehicle.

**When necessary, inform the driver.**

Other actions include:

- Establish and maintain vehicle inspection policies.
- Require a full stop at and avoid driving through red lights.
- Increase attention to policies and equipment to prevent in-come EMT responder accidents.
- Use thorough and comprehensive driver education and training.
- The real-time driver monitoring and feedback drivers.

**Personnel Not Buckling up**

It is a sorry sight to see an EMT in a vehicle, not wearing a seat belt. A survey of more than 200 EMS providers found that 70% of providers do not always use their seat belts. The survey also found that the most common reason for not wearing a seat belt was "I don't know" or "I don't care".

**When necessary, inform the driver.**

Other actions include:

- Consider using best practices. Write and update the vehicle, with a view to behavioral perfection, longitudinal and other safety factors.
- Implement education of the ANWBASIS 214 standard for safe motor vehicle practices.
- Support collection of population-based injury data.

### Ambulance Safety Research: A New Field

### Predictable risks

- ▶ More often at intersections, & with another vehicle ( $p < 0.001$ )\*
- ▶ Most serious & fatal injuries occurred in rear (OR 2.7 vs front) & to improperly restrained occupants (OR 2.5 vs restrained)\*\*
- ▶ 82% of fatally injured EMS rear occupants unrestrained\*\*
- ▶ > 74% of EMT occupational fatalities are MVC related\*\*\*
- ▶ Serious head injury in >65% of fatal occupant injuries#
- ▶ 70% of fatal crashes EMS crashes during Emergency Use#
- ▶ More likely to crash at an intersection with traffic lights (37% vs 18%  $p=0.001$ ) & more people & injuries/crash than similar sized vehicles##

\*Rahn CA, Pivato RC, Kohn EM. *Prehospital Emergency Care* 2001; 10:1-9

 \*\*\*Ray AM, Kubus DF. *Prehospital Emergency Care* 2005; Dec; 9:413-415  
 ##WITCA. *IS 0750* Parts 271, 272 & 500 (October 19, 1978), notice 7.

### and what is killing EMS ?

#### EMS personnel fatalities\*

- ▶ 74% transportation related
  - ♦ 1/5 of ground transport fatalities were struck by moving vehicles
- ▶ 11% were cardiovascular
- ▶ 9% were homicide
- ▶ 4% needle sticks, electrocution, drowning and other

\*Maguire, Hunting, Smith & Levick, *Occupational Fatalities in Emergency Medical Services: A Hidden Crisis, Annals of Emergency Medicine, Dec 2002*

### So does it make sense ?

▶ Gloves and universal precautions? ... good biohazard protection BUT aren't going to give much protection in a ambulance crash

### A word about occupational transportation fatalities..

▶ WE HAVE A BIG PROBLEM HERE

\*Maguire, Hunting, Smith & Levick, *Occupational Fatalities in Emergency Medical Services: A Hidden Crisis, Annals of Emergency Medicine, Dec 2002*

### Unique workplace

- ▶ In vehicles
- ▶ At roadside and other emergency scenes

## the EMS transport process

- ▶ communications/dispatch
- ▶ the patient
- ▶ restraining device/seat
- ▶ transporting device/gurney
- ▶ paramedics/transport nurses, doctors & family
- ▶ patient monitoring equipment
- ▶ clinical care & interventions
- ▶ protective equipment
- ▶ the vehicle
- ▶ the driver/driving skill
- ▶ other road users
- ▶ the road

## The Emergency Department (ED)

## An ambulance is not an ED /ICU on wheels

## EMS Transport Safety IS Complex AND Multidisciplinary

## Vision Zero:

An ethical approach to safety and mobility

### - Claes Tingvall

Vision Zero is a philosophy of road safety that eventually no one will be killed or seriously injured within the road transport system. Vision Zero describes the view that safety cannot be traded for mobility. Sweden's Vision Zero is aimed at eliminating all deaths or long-term health losses arising from road crashes. The mobility in the road transport system should be a function of the safety and not vice versa."

## This is not acceptable

In the USA\*

- ▶ ~ 5,000 crashes a year
- ▶ ~ One fatality each week
  - ~ 2/3 pedestrians or occupants of other car
  - Approximately 4 child fatalities per year
- ▶ ~10 serious injuries each day
- ▶ Cost estimates > \$500 million annually
- ▶ USA crash fatality rate/capita 35x higher than in Australia

\*NARS/RT 2004/5

## Occupational Health and Safety.....?

- ▶ This IS an Automotive Safety issue

## Is it your services tragic year?

- ▶ ~ 50 fatalities a year
- ▶ 15,000 EMS services
- ▶ Each year one in 300 services experiences a fatality

## Paramedic charged in crash that killed 2

By Mike Franck, Rocky Mountain News  
July 21, 2004

STORY TOOLS

STERLING - A paramedic with MetroPound Ambulance has been charged with careless driving in connection with an accident in May that killed two people and injured two others.

Chris Larusso, 32, of Independence, was issued a summons for two counts of careless driving resulting in death and two counts of careless driving resulting in serious bodily injury.

All are misdemeanor charges and carry possible sentences of 10 days to a year in jail and fines of \$100 to \$1,000.

Larusso was driving an ambulance May 9 on Interstate 76, about 15 miles west of Sterling, when he apparently rear-ended a semi tractor truck.

Two passengers in the ambulance - nurse Karen Woods, 43, of Elizabeth, and ultrasound technician Vicky Thomas, 35, of Oodoland, Kan. - were killed.

A patient, Kristy Schlichemeyer, 43, of Burlington, was seriously injured, but hours after the accident, gave birth to a boy at Sterling Regional Medical Center.

Larusso and paramedic Dan Baza, 31, of Centennial, were treated for their injuries and released.

## Key Issues

- ▶ **Mythology**
  - That Emergency Medical Service personnel are safe
- ▶ **Injury Hazards**
  - Biohazard
  - Chemical/Radiation
  - Physical/Mechanical trauma – THE BIG PROBLEM
- ▶ **Motor Vehicle Crashes are the highest cause of death at work** – EMS has > 2X the mean national rate
- ▶ **An R & D and Regulatory Gap**
  - Occupational Health and Safety
    - the workplace is in a vehicle – exposure data are scant
  - **Automotive Safety**
    - a vehicle is the work place – exempt from automotive research and regulation

## Safety oversight of what and by ... whom

- ▶ **Vehicle Safety**
- ▶ **Vehicle Design**
- ▶ **Safety Equipment Design**
- ▶ **Vehicle and Safety Equipment Testing and Standard development**
- ▶ **Safety policies**

## A Simple Question....

### A Simple Question

Andrew Levin, MD, MPH

Why have all these recent fatalities been so high? Is it just the very nature of the job? Or is there something about the way we do our work that is putting us at risk? The reason I wrote this book is to challenge all of you to think about this, and then to do it in your own way. I challenge you to think about the safety of your general EMS practice, and to take a look at the best and right ways to have the best EMS. I challenge you to think about the safety of your general EMS practice, and to take a look at the best and right ways to have the best EMS. I challenge you to think about the safety of your general EMS practice, and to take a look at the best and right ways to have the best EMS.

## Balance of concerns and risk during transport

- ▶ **Response and transport time**
- ▶ **Clinical care provision**
- ▶ **Occupant safety/protection**
- ▶ **Public Safety**

## Benefit of Safety

- ▶ **Any cost of addressing these issues is dwarfed in contrast to the huge burden of not doing so - in financial costs let alone the personal, societal, ethical and litigation costs**

## This is about you and your safety

- ▶ **What safety practices do you use??**
  - Seat belts ?
  - EVOC training ?
  - Equipment lock down ?
  - Helmets ?
  - "Black Box" technology ?
  - Tiered dispatch ?

## NAEMT July 2006 Position statement

**National Association of Emergency Medical Technicians  
Statement on Safety Restraint Use in Emergency Medical Services**

**Background**  
Emergency Medical Services (EMS) throughout the nation has been allowed to use a dangerous practice, although there is ample evidence to show that the correct use of performing the job, technicians within EMS. It is generally accepted that the most likely cause of death of a technician or the patient is due to a vehicle crash. It is estimated that in the United States, there are approximately 10,000 EMS-related fatalities annually, an average of one death per week.

## Tips for Emergency Vehicle Operations

**Alive on Arrival**  
Tip for Safe Emergency Vehicle Operations

**TIPSA**

## General Concerns

- ▶ **Consequences can be predictable & likely preventable**
- ▶ **Costs of these adverse events are high in loss of life, financial burden and negative impact on delivery of EMS care**
- ▶ **Other high speed vehicles (eg. racing cars) have a different safety paradigm**
- ▶ **Design of interventions to mitigate injury is predicated on a valid testing model**
- ▶ **Complex both engineering and public health issues**

## Background: USA Problems

- ▶ No reporting system or database specifically for identifying ambulance crash related injury
- ▶ No occupational and health safety standards to protect providers from injury
- ▶ Rear passenger compartment, > 60cm behind driver - exempt from Federal Motor Vehicle Safety Standards (FMVSS)

## USA Ambulances: FMVSS Exempt

DEPARTMENT OF TRANSPORTATION  
National Highway Traffic Safety Administration

49 CFR Parts 571, 572, and 589  
[Docket No. 82-29; Notice 7]  
[EIN No. 2127-AD85]

Federal Motor Vehicle Safety Standards;  
Rear Impact Protection

Section 589.201 of the Department of Transportation's Federal Motor Vehicle Safety Standards (49 CFR 589.201) requires that all ambulances manufactured on or after September 1, 2002, must meet the requirements of 589.201. This notice is published in the Federal Register for information and to advise the public of the Department's decision to exempt ambulances from the requirements of 589.201. This exemption is based on the Department's determination that the use of 589.201 is not necessary to protect the public from the risks of rear-end collisions involving ambulances. The Department's decision is based on the following factors:

- (1) The Department's determination that ambulances are not used in the same manner as other motor vehicles.
- (2) The Department's determination that ambulances are not used in the same manner as other motor vehicles.
- (3) The Department's determination that ambulances are not used in the same manner as other motor vehicles.
- (4) The Department's determination that ambulances are not used in the same manner as other motor vehicles.

The Department's decision is based on the following factors:

- (1) The Department's determination that ambulances are not used in the same manner as other motor vehicles.
- (2) The Department's determination that ambulances are not used in the same manner as other motor vehicles.
- (3) The Department's determination that ambulances are not used in the same manner as other motor vehicles.
- (4) The Department's determination that ambulances are not used in the same manner as other motor vehicles.

Ambulances must comply with some of the strictest safety and performance standards applicable to vehicles in the United States. All motor vehicles operated on public roads and highways must conform to Federal Motor Vehicle Safety Standards (FMVSS) contained in Title 49 of the Code of Federal Regulations Part 571. Ambulances are no exception. FMVSS are the most visible and vigorously enforced safety standards governing the design, engineering and production of such vehicles. Nearly all government purchased ambulances, and the overwhelming majority of those sold to the public, also must be certified to the safety requirements of the Federal Star of Life Specification for Ambulances, KKK-4-1922, promulgated by the federal government. These requirements are in addition to FMVSS.

FMVSS compliance is the first of the Code of Federal Regulations Part 571, which includes, as an example, 589.201, the rear-impact rear-occupant safety standard. Nearly all government purchased ambulances, and the overwhelming majority of those sold to the public, are certified to the safety requirements of the Federal Star of Life Specification for Ambulances, KKK-4-1922, promulgated by the federal government.

## Very Predictable...

- ▶ Intersections are lethal environments

## "Are our policies killing people?"

- ▶ 1991-2000, 302,969 Emergency vehicles were involved in MVCs - 1,565 involving fatalities\*
- ▶ In PA 1997-2001, ambulances were more likely than similar sized vehicles to be involved in\*:
  - 4 way intersection crashes (43% vs 23%, p=0.001)
  - Collisions at traffic signals (37% vs 18%, p=0.001)
  - MVCs with more people injured (76% vs 61%, p=0.001)

\*Comparison of Crashes Involving Ambulances with those of similar sized vehicles - Adam Ray, Douglas Kupas, PEC Dec 2005;3:412-415

## So.. The real world for an EMS vehicle approaching a red light

- ▶ You think they heard you...
- ▶ You know they must have seen you...
- ▶ And maybe they did
- ▶ ..... But..
- ▶ There is NO way humanly possible that they could stop.....

## The real world Intersection passenger car stopping distance\* at 40 mph dry and wet

## What do we know now??

- ▶ Intersection crashes are the most lethal
- ▶ There are documented hazards, some which can be avoided
- ▶ Occupant and equipment restraint with standard belts is effective. (Over the shoulder harnesses for patients should be used, with the gurney in the upright position where medically feasible)
- ▶ Some vehicle design features are beneficial - automotive grade padding in head strike areas, seats that can slide toward the patient
- ▶ Electronic Driver monitoring/feedback systems appear to be highly effective
- ▶ Head protection??

No need to reinvent the wheel...

'Workplace' Hazards

Hmm...

It isn't like this outside of the USA

This looks cool AND SAFE!

Not rocket science..

USA ambulance purchase specifications  
GSA:KKK-A-1822E, 2002

- ▶ Static Pull test
- ▶ 2200 Lbs. (8G's) in Longitudinal and Lateral
- ▶ No dynamic test
- ▶ No definition to manikin mass
- ▶ No restraint for equipment
- ▶ Voluntary

## The Crash Event - Crash Testing

- ▶ An introduction
- ▶ What one needs to know
- ▶ What do the tests really mean
- ▶ And, what tests are meaningful

## Dynamic Safety Testing

- ▶ requires sophisticated, expensive equipment
- ▶ measurably demonstrates forces generated during collision
- ▶ accepted international standard for vehicle restraint systems

Patients must be in the over the shoulder harness, medics restrained in seat belts, equipment secured

## Full Vehicle Crash Tests

### Test 1 - Right side impact

1 - Side vehicle, Type II ambulance  
2 - Target vehicle, Type II ambulance  
Closing speed 34 mph

### Test 2 - Frontal

1 - Side vehicle, Type II ambulance  
2 - Target vehicle, Type II ambulance  
Closing speed 34 mph

## Safety Management

- ▶ A Safety Culture
- ▶ Protective Policies
- ▶ Protective Devices
  - In the event of a crash
  - To prevent a crash
- ▶ Continuous Education and Evaluation

## EMS Risk/Hazards

- ▶ Predictable risks
- ▶ Predictable fatal injuries
- ▶ Serious occupational hazard
- ▶ Public safety hazards

## Important Principles !

1. A culture of safety
  2. Drive cautiously
  3. Wear your belts & restrain all occupants
  4. Secure all equipment
  5. Integrate scientific data into your policies and procedures
- Unrestrained occupants and equipment are a potential injury risk to all occupants

## Very Important Principle

Ambulance transport safety is part of a SYSTEM, the overall balance of risk involves the safety of all occupants and the public

**small changes can make a  
BIG DIFFERENCE**

- ▶ **PREPARE – TEACH – REACH – RESPOND**
- **Look** at your own safety record
- **Teach** safety and hazard awareness
- **Reach** out with safety information to all your EMS providers
- **Respond** with the best safety practices

**PREDICTABLE  
PREVENTABLE  
and  
NO ACCIDENT**

**Conclusion**

- ▶ EMS transport has serious hazards and safety issues
- ▶ Major advances in EMS safety research, infrastructure and practice over the past 5 years
- ▶ New technologies for vehicle design, occupant PPE and equipment restraint and driver performance are now available
- ▶ Development of substantive EMS safety standards is a necessity and a reality
- ▶ Enhanced cross disciplinary collaboration in development of safety initiatives now exist
- ▶ EMS is still way behind the state of the art in vehicle safety and occupant protection

**And....**

- ▶ It is no longer acceptable for EMS to be functioning outside of automotive safety and PPE safety standards for prevention of and protection of EMS providers and the public from injury and death

**Any Questions??**

Electronic handout available online  
<http://www.objectivesafety.net>
